S&P Global Market Intelligence Outlook Projects New Trade Patterns in the Aftermath of Russia-Ukraine Conflict

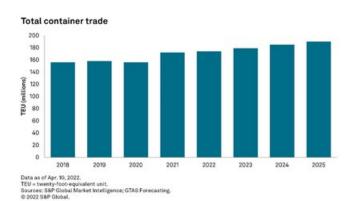

NEW YORK, Nov. 7, 2022 /PRNewswire/ -- In the wake of significant bilateral trade volatility betweerRussia and nearly all markets due to the war in Ukraine, India has emerged as a strong trade partner ofRussia and is expected to remain so in 2023, according to a new S&P Global Market Intelligence report released today. The newly published 2023 Global Trade Outlook is part of S&P Global Market Intelligence's Big Picture 2023 Outlook Report Series.

The new report highlights the anticipated shifts in trade due to the Russia–Ukraine conflict as well as positive outlook for containerized trade in 2023 despite a mere 0.7% year-on-year (y/y) growth in 2022 led by the estimated slowdown in the second half. It also highlights the impact of the new International Maritime Organization (IMO) greenhouse gas reduction measures that will be introduced in 2023.

"The trade value of total imports fromRussia has increased in recent months, primarily due to rising oil, gas and coal prices, as well as spikes in Russian imports by several countries. This group is led by India, which noted a greater than 100% y/y increase in Russian import trade values each month after the Russia-Ukraine conflict started in February 2022," said **Agnieszka Maciejewska, Economics Manager at S&P Global Market Intelligence.**

Key highlights from the report include:

- Global shifts in trade: India is forecast to see an acceleration in trade in 2023, thanks to its significant increase in imports from Russia. Its trade value is projected to increase by 3.5% y/y in exports and by 1.3% y/y in imports, while its trade volume is projected to grow 3.8% y/y and 7.3% y/y, respectively.
- Mainland China is expected to be the biggest importer from Russia in 2023, followed by Turkey, Belarus and Kazakhstan. However, China's current economic slowdown adds considerable uncertainty to the outlook. Western trading partners will lose their significance in Russia's trade turnover. This trend will become even more visible ifRussia cuts gas supplies to Europe in the winter of 2022–23.
- Containerized trade outlook: S&P Global Market Intelligence's Global Trade Analytics Suite (GTAS) forecasting projects containerized trade to increase by 3.2% y/y in 2023, following a 0.7% y/y growth in 2022.
- U.S. container imports is forecast to grow 5.9% y/y in 2022 and 4.2% y/y in 2023. With U.S. warehouses being full, major carriers started removing capacity on the Asia-US trade lane, although not yet on a massive scale. With no peak season this year, carriers will take out a significant amount of capacity to protect and boost their rates.
- With mainland China's containerized exports accounting for more than 50% of its total exports, this type of cargo should
 face significant long-term impacts from the country's economic challenges, a situation not expected to change anytime
 soon.
- IMO decarbonization goals: Beginning January 1, 2023, the maritime industry, which is highly dependent on fossil fuels,
 will have to comply with the new short-term greenhouse gas reduction measures implemented by the IMO. This will likely
 result in higher average increase in maritime logistics costs and a slowdown, albeit marginally, in global trade and
 economic growth.
