

More than 75 Percent of Oil and Gas Production in the U.S. Gulf of Mexico has Lower than Average Greenhouse Gas Intensity, New Analysis Finds

Emissions intensity of production expected to decline further due to continued shift towards newer and more productive operations in the deepwater, other factors

HOUSTON, July 13, 2023 /PRNewswire/ -- More than three-fourths of all oil and gas production in the U.S. Gulf of Mexico has a lower greenhouse gas (GHG) intensity than the basin-wide average, [a new S&P Global Commodity Insights analysis](#) finds. The analysis is the latest in an ongoing series that utilizes a new comprehensive model that provides unprecedented granularity to understand variations in GHG intensity from one asset to the next.

The average GHG intensity of production in the U.S. Gulf of Mexico was found to be 7 kilograms of carbon dioxide equivalent per barrel of oil equivalent (kgCO₂e/boe) in 2022. However, about 78% of the total production was found to be beneath that average. Conversely, assets on the upper bound of carbon intensity—responsible for just 10 percent of total production—generated 35% of the basin's total GHG emissions. Overall, individual assets across the basin displayed a wide variability, ranging in GHG intensity from less than 2 kgCO₂e/boe to nearly 50 kgCO₂e/boe for most production.*

Commodity Insights

"A relative minority of less-productive assets were found to be responsible for a disproportionate amount of emissions," said Christopher Kennett, Technical Research Associate Director, S&P Global Commodity Insights. "This trend—along with the tendency for there to be a wide variability in the GHG intensity from any one asset to the next—underscores the limits of placing too much significance on overall averages when considering the GHG intensity of any given asset."

The considerable variation in intensity levels is consistent with findings for other basins. A previous S&P Global Commodity Insights [analysis of North Sea production](#) found that basin to have an average intensity of 12 kgCO₂e/boe in 2021 with individual assets ranging from less than 1 kgCO₂e/boe to nearly 150 kgCO₂e/boe.

The analyses are derived from a new S&P Global Commodity Insights capability that provides a novel and comprehensive approach to estimating upstream oil and gas production emissions. The new capability, built upon existing proprietary upstream databases and emerging sources such as reported emissions and satellite flaring data from the Earth Observation Group, makes it possible to estimate the totality of an upstream oil and gas play's emissions and emissions intensity—from across the play, down to individual assets and the sources of emissions, such as the fuels, that underpin each operation.

Several factors ultimately influence the GHG intensity of an asset. These include productivity, where younger and more productive fields tend to be less GHG intensive than older, more geologically challenging fields. The latter also may require energy-intensive enhanced recovery techniques, increased drilling to maintain productivity, and older technology can also put upward pressure on emissions intensity. Other factors include the degree to which operations can be electrified and the amount of venting and flaring that occurs.

In the case of the U.S. Gulf of Mexico, key disparities were observed between production coming from the deepwater compared to more shallow shelf terrains. Shelf production was found to have a GHG intensity that was more than twice as high, on average, as deepwater on account of shelf production tending to come from more mature, and thus less productive, wells as well as processes that utilize more venting. Deepwater production—which constituted 86% of all production in the U.S. Gulf of Mexico in 2022—tends to come from newer wells that utilize more technologically advanced techniques.

"The share of production in the U.S. Gulf of Mexico coming from deepwater has increased by approximately 14% over the past decade," said Tomos Phillips, Senior Technical Research Analyst, S&P Global Commodity Insights. "That expansion of newer, and thus more productive operations that leverage the latest technology has decreased the region's emissions intensity by 25% from 2012 to 2022 and we expect the basin's emissions profile to remain steady in the near term as more production shifts from the shelf to deepwater."

A heightened focus on decarbonization may contribute to additional declines in GHG intensity for the basin in the coming decades. Additional declines could occur from deployment of carbon capture utilization and storage technology as well as expanded use of renewable power—such as offshore wind turbines—to provide less carbon-intensive fuel sources for production in the region, the analysis says.

* The 2 kgCO₂e/boe to nearly 50 kgCO₂e/boe range includes 99% total 2022 production covered by the US Gulf of Mexico analysis. The full range, including outliers, extends up to c. 900 kgCO₂e/boe. For comparison, the GHG intensity range for 99% total 2021 production across the North Sea study area extends to c. 70 kgCO₂e/boe.

About S&P Global Commodity Insights

At S&P Global Commodity Insights, our complete view of global energy and commodity markets enables our customers to make decisions with conviction and create long-term, sustainable value.

We're a trusted connector that brings together thought leaders, market participants, governments, and regulators and we create solutions that lead to progress. Vital to navigating commodity markets, our coverage includes oil and gas, power, chemicals, metals, agriculture, shipping and energy transition. Platts® products and services, including the most significant benchmark price assessments in the physical commodity markets, are offered through S&P Global Commodity Insights.

S&P Global Commodity Insights is a division of S&P Global (NYSE: SPGI). S&P Global is the world's foremost provider of credit ratings, benchmarks, analytics and workflow solutions in the global capital, commodity and automotive markets. With every one of our offerings, we help many of the world's leading organizations navigate the economic landscape so they can plan for tomorrow, today. For more information visit <https://www.spglobal.com/commodityinsights>.
